### Quantitative Methods in Health Systems Research I

# **HAD 5744** Fall 2024

**Instructor**: Alex Hoagland, Ph.D.

Assistant Professor of Health Economics, IHPME

155 College Street, Suite 440 <u>alexander.hoagland@utoronto.ca</u>

Class time and location: Fridays, 1pm-3pm. Location TBD

**Office hours:** Book appointments at calendly.com/Hoagland-office-hours/

- Tuesdays and Thursdays: 1:00pm to 3:00pm, or by appointment.
- All appointments are by Zoom unless arranged otherwise in advance.
- Please note that I typically respond to emails and other class communication during normal "business hours," and not on evenings, weekends, or holidays.

Course Description: Introduces quantitative (econometric) methods frequently used in health systems research, as well as in applied health economics and health policy. In many applications, researchers want to understand a process by which data and outcomes are generated; however, many data generating processes (DGPs) are possible given observed data. This course deals with how to determine *which* DGPs, and hence which "story", has generated your data. The course uses applications of statistical tests and procedures in the context of distinguishing between models and explores the applications of a range of frameworks to the types of questions addressed by social scientists and health services researchers. It is assumed that students have a basic (graduate) training in statistics.

#### **Evaluation Criteria**

• <u>Assignments</u>: 3 group assignments, each worth 20% of the final grade.

• Major Evaluation or Proposal (see below): worth 40% of the final grade.

<u>Assignments</u> are to be completed using R or STATA.<sup>1</sup> Assignments and data sets will be posted on the course website. Due dates are listed on the schedule below. The assignments **must be submitted via email** before class on the due date; late assignments will be penalized at the rate of 10 percentage points per day. Please submit your assignment with the file name "Econometrics\_AssignmentX\_LastName" (e.g., X = 1, 2, 3). Assignments may be done in groups, but each person must submit their own code and output.

In addition, each student must complete a major evaluation or paper proposal. PhD students are expected to do a paper proposal; Msc students have the option to either write 2 referee reports over the course of the semester, or to be a part of a paper proposal.

<sup>&</sup>lt;sup>1</sup> I strongly encourage you to use R unless you feel very comfortable with Stata. We will only discuss R coding principles and examples in class; in previous years, students have attempted to use Stata and then felt they could not engage in group assignments as easily, given the lack of Stata supports. Unfortunately, we can't cover all the coding languages we would like to in only 14 weeks!

<u>Paper Proposal</u>: The paper provides students with an opportunity to undertake an investigation of a research question of their own choosing on a self-contained topic within the fields of health economics or health services research. Writing will also help with communication skills and familiarization with the structure of journal manuscripts. <u>Students are expected to pair up in groups of no more than four (and no less than two) to produce a paper.</u>

To find data for the project, I recommend using publicly available data: a primer on where to look can be found <a href="https://example.com/here">here</a>. For example, there are public use files for the Canadian Community Health Survey (CCHS). Other health related surveys can be downloaded at CHASS <a href="http://sda.chass.utoronto.ca/">http://sda.chass.utoronto.ca/</a>). We will discuss these options more in class.

Students will hand in an outline of their major paper due October XXX. The major paper must include a brief introduction and literature review, description of data, variables, and methods employed. The final paper should include these as well as results, discussion and conclusion. The paper should be presented in the form of a journal manuscript (either health economics/policy or clinical). The final paper is due December XXX.

Referee Reports: If you are an Msc student and are not doing a paper proposal, you must instead submit 2 referee reports over the course of the semester. A referee report critically evaluates a recent HSR paper for its statistical (internal) validity and causal inference techniques, as well as providing suggestions for improvement and future work. For each course topic, there is a list of papers indicated on the reading list (there are approximately three choices per topic). You must select papers from two different topics. Your referee report should include: (1) a brief summary of the paper; (2) major concerns you have, including any potential flaws or drawbacks you see in the modeling choices; and (3) minor concerns you have, including ideas for extensions and future research. Your referee report should be no more than 3 pages long. Reports are due one week after the topic has been covered in class. Late reports will be discounted by 10 percentage points per day late.

**Grading scale:** Courses taken for graduate credit are assigned a letter grade according to the School of Graduate Studies usage as follows. While course grades may be collectively "curved," no individual grades will be rounded.

Letter Grade	Grade Meaning	Numerical Marks
		(%)
A+	Excellent	90%-100%
A		85%-89.9%
A-		80%-84.9%
B+	Good	77%-79.9%
В		73%-76.9%
B-		70%-72.9%
FZ	Inadequate	0-69%

**Course website:** This course has a Github repository that contains all relevant materials; you can access the repo at <a href="https://github.com/alex-hoagland/HAD5744">https://github.com/alex-hoagland/HAD5744</a>. Each lecture has a folder containing the slides, code, and example papers. The assignments folder contains the relevant

questions and data sets. Materials will be updated and/or added throughout the semester.

**Software**: We will make use of R and RStudio. You do not need a license for R or RStudio and it can be downloaded for free at <a href="https://www.r-project.org/">https://www.r-project.org/</a> and <a href="https://www.r-project.org/">https://rstudio.com/</a>. Learning R or any program for the first time can be frustrating. Sometimes you can get really bogged down from not knowing a simple command or syntax. This is normal, and part of the learning process. The best way to learn is by relying on the built-in help functions, online short tutorials, class participation or by taking a short course. I am happy to respond to specific questions during the office hours and during class.

I recommend these slides as a good starting guide for R: <a href="https://nickch-k.github.io/EconometricsSlides/Week">https://nickch-k.github.io/EconometricsSlides/Week</a> 01/Week 01 Slides 2 Starting R.html#1

An introductory 2-hour R session will be offered on September XX and an introductory session on STATA will be offered on September XX by the Canadian Centre for Health Economics (CCHE) as part of the CCHE Friday seminar series from 10:00 a.m. to 12:00 p.m. You are strongly encouraged to attend these sessions (and the remainder of the seminar series!)

**Required texts:** Both books have a free e-book version or are relatively cheap buys on Amazon. I *highly* recommend owning print copies if you plan to pursue applied research – they are both very handy. **Course readings are expected to be completed prior to class.** 

- "The Effect," Nick Huntington-Klein (NHK).
- "Causal Inference: The Mixtape," Scott Cunningham (SC).

#### Additional (non-required) reading:

- "Principles of Econometrics, 5th edition", R. Carter Hill, William E. Griffiths and Guay C. Lim (HGL).
- A useful online resource: https://tinyurl.com/bdzxbxce
- Example papers for each method are included in the Github repo.

## **Course Schedule**

Session	Date	Lecture / Readings	Assignments Due
#	0 (	Recommended readings in italics	
1	Sep. 6	Econometric Philosophies: DAGs and Potential Outcomes	
	G 12	• SC Introduction, Chapters 2-3 (p. 96-148)	
2	Sep. 13	Probability + Coding Review, Univariate OLS	
		• SC, Chapter 1 (p. 16-58)	
2	G., 20	HK, Chapter 4      No. 1, Co. 1,	
	Sep. 20	Regression I: Setup & Inference	
		• SC, Chapter 1 (pg 63-95)	
		• HK, Chapter 12-13 (pg. 175-200)	
4	Sep. 27	Regression II: Additional Topics	
		• HK, Chapter 13 (pg. 201-266; can omit pages 226-232)	
		Case Study: Michaelsen, M. M., & Tolan, S. (2012). Children at Risk: The	
		Effect of Crop Loss on Child Health in Rural Mexico. Ruhr Economic	
		Paper, (376).	
5	Oct. 4	Data Cleaning and Research Designs	
		• No readings	
N/A	Oct. 11	No class, Fall Reading Week	Assignment 1 due
6	Oct. 18	Matching Methods	
		• SC, Chapter 4 (p.175-240)	
		• HK, Chapter 14	
		Case Study: Shahidi, F. V., Muntaner, C., Shankardass, K., Quiñonez, C., &	
		Siddiqi, A. (2019). The effect of unemployment benefits on health: a	
		propensity score analysis. Social Science & Medicine, 226, 198-206.	
7	Oct. 25	Instrumental Variables Regression	
		HK, Chapter 19 (also chapter 9 if you're interested in front-door	
		approaches)	
		• SC, Chapter 7 (p. 315-385)	
		Case Study: Eliason, P., Heebsh, B., League, R., McDevitt, R., & Roberts,	
		J. (2022). The effect of bundled payments on provider behavior and	
		patient outcomes: evidence from the dialysis industry. R&R, American	
		Economic Review	
8	Oct. 28	Limited Dependent Variables I: Binary and Count Data	Paper Outline due
		• HK, pages 226-232	
		Case Study: Bruhin, A., Goette, L., Haenni, S., & Jiang, L. (2020).	
		Spillovers of prosocial motivation: Evidence from an intervention study on	
		blood donors. Journal of health economics, 70, 102244.	
9	Nov. 1	Limited Dependent Variables II, and Identification	
		Case Studies (2!):	
		- Buchmueller, T. C., Jacobson, M., & Wold, C. (2006).	
		How far to the hospital?: The effect of hospital closures	

		on access to care. <i>Journal of health economics</i> , 25(4), 740-761.  - Kreider, B., Manski, R. J., Moeller, J., & Pepper, J. (2015). The effect of dental insurance on the use of dental care for older adults: a partial identification	
NT/A	1	analysis. <i>Health economics</i> , 24(7), 840-858.  Add/drop deadline	
N/A 10	Nov. 4	Differences-in-Differences	Aggignment 2 due
10	Nov. 8	• HK, Chapter 18	Assignment 2 due
		• SC, Chapter 8-9 (p. 406-510)	
		Case Study: Kessler, J. B., & Roth, A. E. (2014). Don't take 'no' for an answer: An experiment with actual organ donor registrations (No. w20378). National Bureau of Economic Research.	
11 Nov. 15	Nov. 15	Synthetic Controls & Quantile Regression	
		• SC, Chapter 10 (p. 511-539)	
		• HK, Section 21.2.1 (pages 555-559)	
		Case Studies (2!):	
		- Geloso, V., & Pavlik, J. B. (2021). The Cuban	
		revolution and infant mortality: A synthetic control	
		approach. Explorations in Economic History, 80, 101376.	
		<ul> <li>Carrieri, V., &amp; Jones, A. M. (2017). The income—health relationship 'beyond the mean': New evidence from</li> </ul>	
		biomarkers. <i>Health economics</i> , 26(7), 937-956.	
12	Nov. 29	Class Presentations • Please review each other's slides prior to class	Assignment 3 due, Class Presentations
13	Dec. 6	Class Presentations	
		• Please review each other's slides prior to class	
N/A	Dec. 15		Final Paper Due
